Protect Yourself and Your Family from Radon

Radon is the second leading cause of lung cancer in the United States after smoking.

Radon is an odorless and invisible radioactive gas naturally released from rocks, soil, and water. In outdoor environments, radon levels are very low and generally not considered harmful.

Radon can get into homes or buildings through small cracks or holes and build up to higher levels. Over time, breathing in high radon levels can cause lung cancer.

The good news is that lung cancer from radon is preventable. Learn how to:

Test Your Home

Reduce Radon In Your Home

Low Resolution Video

According to estimates from the Environmental Protection Agency:

- Radon causes over 21,000 lung cancer deaths each year.
- 1 in 15 homes in the United States have high radon levels.
